

PSPDFKit

Link Annotation to an external file

You can both use the Launch annotation type ("Open a file" in Acrobat). This annotation subtype doesn't support setting a page target, so page 0 will be used.

Another option is using regular web link annotations ("Open a web link" in Acrobat). The same path resolving methods as with other link annotations are used. Use `/localhost/PSPDFKit.pdf#page=3` to link to the file `PSPDFKit.pdf` at page 3.
